Post

 **Jesse brodkin** @jesse_brodkin · Dec 6, 2021

They ditched the 3 month blinded extension for this reason.

 **Lawrence Shaw** @lawrenceshaw82 · Dec 6, 2021

Then, they would also have found a reason to ditch the CMS readout 😊 especially when there is little need for it as P3 is underway. Also, can someone remind us when the ditching of the 3 month blinded extension was done? The exact date when it was announced ..

 **Lawrence Shaw** @lawrenceshaw82 · Dec 6, 2021

It looks like the blinded extension was supposed to start well before CP. No reason for Cassava to have not started it since they can "fake" its 3 month results per your suspicions. Back then, they weren't under this type of scrutiny. So I don't know how it matters in this context

 **Phloeodes Diabolicus** @PatricioMarceso · Dec 6, 2021

It was supposed to be a randomized placebo controlled blinded study, therefore not as easy to fake/manipulate (see non significant cog. results of P2b), so that might be a pretty good incentive to silently drop it!

 **Lawrence Shaw** @lawrenceshaw82 · Dec 6, 2021

The FUD you guys are peddling with OL is that everything flows through Remi just before public presentation. And therefore it's easy to fake stuff despite the chain of custody that exists prior to the last step. Please stay focussed and stick to one theory.

 **Phloeodes Diabolicus** @PatricioMarceso · Dec 6, 2021

Yeah, open label is, who would have thought, open. So that would be easier to manipulate than a blinded, placebo controlled study (easier to get rid of data points on the go, during study), which is why they might have said "Let's get rid of that, we can't easily manipulate it!"

 **Eshaan Rao** @SaltTheSnail7 · Dec 6, 2021

Also begs the question of why Sava is doing so many questionable practices in their trials. If they truly had a miracle drug, wouldn't they want to thoroughly convince everyone it's legit, especially when their proposed MOA is entirely novel?

 **Eshaan Rao** @SaltTheSnail7 · Dec 6, 2021

No other reputable early stage biotech does even half the shady stuff Sava does. At every turn they've done the exact opposite of what would inspire confidence in their research and practices. Occam's razor suggests an obvious reason for why they've done so

 **Walter_Mitty_007** @007_mitty · Dec 6, 2021

This argument is circular:

- 1.) Phase 2s are unreliable/too small/subject to fakery.
- 2.) Do more Phase 2s to prove something.

And yes, I refer to blinded or unblinded - confident you'd claim something either way.

Phase 3 is gold standard. Being done. See ya.

Post Q 1 t 8 ...

Jesse brodkin @jesse_brodkin · Dec 6, 2021

He'll tell you there was a trend and that totally makes sense from what we've learned about the mechanism yadda yadda (that's if he doesn't totally cook the books)

Q 3 t 8 ...

Lawrence Shaw @lawrenceshaw82 · Dec 6, 2021

Lol there's no way in hell CMS can be "cooked" from here on. It's RCT and in great spotlight. Can't believe you can't even concede that one 😊

Q 1 t 8 ...

Arthur Singer @sing3r · Dec 6, 2021

If this is a scam by design, why would they maintain all of these early data readouts instead of simply pushing off scrutiny and relying solely on a P3 that is years away?

Q 3 t 4 ...

Jesse brodkin @jesse_brodkin · Dec 6, 2021

They ditched the 3 month blinded extension for this reason.

Q 3 t 4 ...

Lawrence Shaw @lawrenceshaw82 · Dec 6, 2021

 **Eshaan Rao** @SaltTheSnail7 · Dec 6, 2021

Yea no one publicly has voiced any support. You'd think if any believed a true miracle pill for AD was being falsely attacked, they'd speak out no?

1 reply · 1 retweet · 1 like · 1 share

 **Walter_Mitty_007** @007_mitty · Dec 6, 2021

I don't put any weight in it.

Most real scientists want to stay out of this.

2 replies · 1 retweet · 1 like · 1 share

 **Jesse brodkin** @jesse_brodkin · Dec 6, 2021

No one wants to be associated with the cure of the century, yeah that's it 😊

3 replies · 1 retweet · 2 likes · 1 share

 **Walter_Mitty_007** @007_mitty · Dec 6, 2021

To be clear - I've never maintained nor believe this is 'the cure of the century'.

I don't believe Cassava has either. Remi B has stated he believes AD will need a multi faceted approach.

1 reply · 1 retweet · 1 like · 1 share

 **Jesse brodkin** @jesse_brodkin · Dec 6, 2021

My dude, it REVERSES cognitive decline, these patients are literally getting smarter within weeks of taking Simufilam... SavaDX will identify AD years before onset with 100% accuracy and S will be started immediately (if it wasn't a total scam of gullible idiots that is 😊)

2 replies · 4 likes · 1 share

 **Walter_Mitty_007** @007_mitty · Dec 6, 2021

^ I'd be careful on the above, you're claiming efficacy out of a phase 2. 😊😂

Hey listen, times winding down, we'll see how you folks did soon enough.

1 reply · 1 retweet · 1 like · 1 share

 **Jesse brodkin** @jesse_brodkin · Dec 6, 2021

You've got 2 years minimum for the P3s, then the fail and then the "re-do" then raise rinse-repeat... given the gullibility of his share holders he could be fleecing you guys for a decade

1 reply · 2 likes · 1 share

 **Lawrence Shaw** @lawrenceshaw82 · Dec 6, 2021

Oh I will change my mind of course if P3 fails or CMS is an abject failure. If the shorts are right about the "total scam" theory, CMS has no shot. I mean ..zero. And we should know that in less than a year. So we will see. This won't be too prolonged

1 reply · 8 likes · 1 share

 **Jesse brodkin** @jesse_brodkin · Dec 6, 2021

Yep very depressing. This one too btw. How could graphs D & F be so identical? They seem like different experiments (each repeated n = 3 times?) Not sure what's going on here.

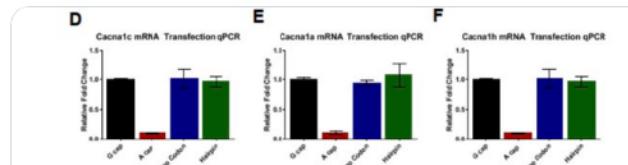

Figure 6. *CACNA1C*, *CACNA1A*, and *CACNA1H* mRNAs encode two distinct proteins from overlapping exons through a cap-independent mechanism. (A,B,C) Western blot analysis of HEK293 protein lysates transiently transfected with *CACNA1C* (A), *CACNA1A* (B), or *CACNA1H* (C) *in vitro* transcribed mRNA. Full-length mRNAs were capped with either an m7G or an m7A cap. STOP construct had two premature termination codons inserted upstream of C-terminal protein start sites. 5'-hairpin constructs had a large hairpin structure inserted directly downstream of the initiating methionine. (D,E,F) qPCR analysis of RNA collected from HEK293 cells transiently transfected with *CACNA1C* (D), *CACNA1A* (E), or *CACNA1H* (F) mRNA. (n=3 for each condition).

As for the binding affinity claims, Todd in Yahoo saved some analysis on my end. I will bet he is right. Anyway, to summarize, no reading this supplement didn't evoke the reaction you were hoping for. It was more like 🤦‍♂️ 🤦‍♂️ 🤦‍♂️

Todd 3 hours ago

I'm not a scientist but the attachment to the CP today seems to be centered around this statement.

Our recent re-inspection of the Methods section for this crucial experiment shows seemingly irrefutable evidence of data manipulation/fabrication. The section states: "P71-125's affinity for tRNA was determined in immunopurified FLNA using [C14]P71-125 (57.7 Ci/mmol)... Briefly, a binding curve was generated by incubation of 0.1 µg immunopurified FLNA from control or AD hippocampus..."

more so dialing in on the specific activity of [C14] in [C14]P71-125 (57.7 Ci/mmol) where pure [C14] specific activity is 62.5 mCi/mmol.

Let's assume for just a second that their argument is valid.
1) Peptides containing one [C14] would have a specific activity of 50-60 mCi/mmol off by an order of magnitude (1000 to [C14]P71-125: 57.7 Ci/mmol).

Post

'Our recent re-inspection of the Methods section for this crucial experiment shows seemingly irrefutable evidence of data manipulation/fabrication. The section states: 'PTI-125's affinity for FLNA was determined in immunopurified FLNA using [C14]PTI-125 (57.7 Ci/mmol) ... Briefly, a binding curve was generated by incubation of 0.1 µg immunopurified FLNA from control or AD hippocampus ...'

more-so dialing in on the specific activity of [C14] in [C14]PTI-125 (57.7 Ci/mmol) where pure [C14] specific activity is 62.5 mCi/mmol.

lets assume for just a second that their argument is valid.
 1) Peptides containing one [C14] would have a specific activity of 50-60 mCi/mmol off by an order of magnitude (1000 to [C14]PTI-125: 57.7 Ci/mmol)
 2) is it a possibility that there was a human error leaving the "m" out of the documentation? where it should have been documented [C14]PTI-125 (57.7 mCi/mmol)

The argument in supplement is then reduced to toilet paper. Since the clinical trial results support Simuflam, it appears that the entire CP is based on a clerical error and not the underlying science.

Hope the FDA sees this quickly

Honest question: Doesn't it become tiring constantly having to come up with reasons why something can be defended / justified? At which point does the evidence finally add up and become overwhelming? Never? Maybe \$SAVA then should file for tax exemption, as religious institution.

Ask him. I've more been focused on all the other binding displacement data, such as that detailed in the '068 patent. col 147, sec. E. (where \$SAVA used FITC-NLX). Or what's detailed in Fig 2 & 3 on pg 3 of the following (which used [3H-NLX]).

journals.plos.org/plosone/article...

Adrian H @Adrian_H · Dec 9, 2021

Which one of those provides evidence for binding of the actual \$SAVA drug, Simuflam, to the actual supposed target, FLNA? (I thought you told me that the "cryptic binding sites" on the native protein were critical..)

\$SAVA isn't going to be able to BS their way out of this..

Q 1

T

Heart 3

More

Bookmark

Jake Schaible #BannedByTrump @JJSchable · Dec 9, 2021

For nth time, I remain agnostic if direct binding of PTI-125 to FLNA is real as I retain other hypothesis, ex: allosteric interaction with a key FLNA binding partner, or A strand inhibitor. Still, there's clear in vivo data that shows FLNA related activity outside the Wang lab.

Q 2 • • • • • •

Adrian H @Adrian_H · Dec 9, 2021

Wut? The premise of the entire charade (both for AD and for Bordey's bizarre claims) is that the drug binds FLNA. The key data [\\$SAVA](#) showed to establish that is physically impossible and MADE UP. It is all a complete fraud.

Q 1 • • • • • •

Jesse brodkin @jesse_brodkin · Dec 9, 2021

Since the patent contains fraudulent data, even if it does "work" (it won't) it will be the company with the best chemical manufacturing and distribution that will make money of it, and that ain't [\\$sava](#)

Q 3 • • • • • •

Jake Schaible #BannedByTrump @JJSchable · Dec 10, 2021

At a minimum, you do know about data exclusivity, right? Even if zero patent (highly unlikely) newly approved NCEs are granted periods data exclusivity. Ex. in EU, 8 yrs. In some cases, this is longer than remaining patent term.

ema.europa.eu/en/glossary/da...

Q 2 • • • • • •

Adrian H @Adrian_H · Dec 10, 2021

AYFKM?

Give it up Jake.. you are embarrassing yourself. What do you think you are accomplishing?

Q 2 • • • • • •

Jake Schaible #BannedByTrump @JJSchable · Dec 10, 2021

Are you seriously unaware of EMA & FDA data exclusivity grants? Or it this just another case of you being triggered by actual facts which contradict your narrative?

From fda.gov

Q 3 • • • • • •

Finding Nemo @Nemo_is_NoOne · Dec 10, 2021

Jake, would you please comment on \$SAVA's clinical trial conduct? Let's set aside the science for a moment, could we look at the new evidence and say whether [\\$SAVA](#) violated FDA guidelines for clinical trials? Shouldn't FDA look into this first?

Q 2 • • • • • •

Chris @kickmofoass · Dec 11, 2021

Not FDA's responsibility to look into Joppa violation.

Q 1 • • • • • •

Jesse brodkin @jesse_brodkin · Dec 11, 2021

That would be hhs, reported to them yesterday
